Sample Project Report Outline

One detailed report: everything about your project, in one PDF, written in Word or LaTeX

What the report is

Your final project is **one report**, worth 90% of the project mark, plus a ten-minute personal interview, in person, worth 10%, in the week of Monday 11 January 2027. The report holds everything: your law, your answer sheet, your model, your comparison, your checks, your discussion, your repository link and your AI-use log. Aim for about 3,500 words (3,000 to 4,000), not counting tables, figure captions, references and appendices.

Write it in **Word** (Word template) or **LaTeX** (LaTeX template, which also works in Overleaf). Either way, submit one PDF, named **StudentNumber_Surname_Report.pdf**, by **23:59 on Wednesday 6 January 2027**.

The report at a glance

Section	Words	Marked under
Title page		R6
Declaration and AI-use statement		R5
Summary	150	R6
1. The person and the problem	350	R4
2. The law	300	R1
3. The answer sheet	150	R1
4. The model	450	R1
5. The comparison	550	R2
6. Checks and limits	400	R3
7. Large language models and this problem	350	R4
8. How I worked: AI tools in my workflow	350	R4, R5
9. Where this is heading	350	R4
10. Conclusion	150	R6
References		R6
Appendix A · Repository and how to run		R5
Appendix B · AI-use log		R5

How it is marked

Part	Weight	Learning outcomes
R1 · The law, the answer sheet and the model	15%	LO3, LO7
R2 · The benchmarked comparison	20%	LO3, LO7
R3 · Checks and limits	15%	LO3, LO7
R4 · Critical discussion: the person, LLMs, your way of working, the trend	25%	LO3, LO5, LO7
R5 · Reproducibility and process: repository, README, AI-use log, weekly steps	10%	LO5
R6 · Clarity and presentation of the report	5%	LO3, LO5, LO7
IV · Personal interview (in person)	10%	LO3, LO5, LO7

Section by section

Title page

- Project title, your name and student number, the module, the date.
- Your repository link, and the commit or tag of the final version.
- Your word count.

Class example: “Is the starter ready? A model that learns logistic growth with no data”.

Marked under R6.

Declaration and AI-use statement

- Two or three sentences: the work is your own, and how you used AI tools in general terms. The detail goes in section 8 and Appendix B.

Marked under R5.

Summary (about 150 words)

- Your question, your law, your main result with a number, and what it means for your person.

Marked under R6.

1. The person and the problem (about 350 words)

- Who would use your answer, and how they work today.
- What your model would change for them.
- Your question in one sentence, and your success test as a number.

Class example: A home baker deciding when the starter is ready to bake with; success: the height at 8 hours within 0.1 cm of the exact formula.

Marked under R4.

2. The law (about 300 words)

- The law in words, then the equation.
- A table of every constant: value, unit and source.

- The starting value, the range you look at, and your law's shape (one thing, two or three things, or along a line).
- What the law leaves out.

Class example: How fast it rises = r × height × (1 − height ÷ top of jar); r = 0.5 per hour (a baking book), top of jar 12 cm (measured).

Marked under R1.

3. The answer sheet (about 150 words)

- How you made it: the exact formula, the solver, or both.
- Figure: the answer sheet, with both lines if you have both.
- How well they agree, as a number.

Marked under R1.

4. The model (about 450 words)

- How it learns from the law: guess, check against the law at the checking points, blame, nudge; no data.
- How the start is built in; the size of the network; the training settings.
- Figure: the loss curve. Figure: the model against the answer sheet.
- The error, and whether it passes your success test. Any problem you hit and how you fixed it.

Marked under R1.

5. The comparison (about 550 words)

- How the example-learner was set up: points from your answer sheet with a little noise; same size and training time.
- Table: accuracy, time per answer and size for your model and each example-learner.
- Figure: error against the number of examples.
- The outside-the-range test, and the smallest version of your model that still passes your success test.
- Your answer to your comparison question, in one sentence with a number.

Marked under R2.

6. Checks and limits (about 400 words)

- Table: the three checks (new points; something that must always be true; the 20% wrong-law test) with their results.
- What each result means for your person.
- What the law leaves out, and what that means for someone relying on your model.

Class example: Must always be true: the starter never rises above the top of the jar and never shrinks.

Marked under R3.

7. Large language models and this problem (about 350 words)

- How a large language model works, in your own words.
- What it would take to do your job with one: data, size, cost, accuracy; consider smaller and faster models (Weeks 8 and 9).
- When an LLM would be the better choice, and when your model would.

Marked under R4.

8. How I worked: AI tools in my workflow (about 350 words)

- Which AI tools you used, and for what: understanding the law, writing and fixing code, tests, the README.

- One example where a tool helped, and one where it was wrong, and how you found out.
- How these tools changed the way you worked. This must match your AI-use log.

Marked under R4, R5.

9. Where this is heading (about 350 words)

- Is science-inspired AI real progress or hype for your person? Use Week 1′s seven questions.
- Assess at least one of edge computing, federated learning or quantum approaches for your use.

Marked under R4.

10. Conclusion (about 150 words)

- Your answer to your question, the main limit, and one thing you would do next.

Marked under R6.

References

- Every source for your numbers and claims, in any consistent style.

Marked under R6.

Appendix A · Repository and how to run

- The repository link and final commit; the notebooks and what each does; how to run them in Colab; the random seed.

Marked under R5.

Appendix B · AI-use log

- Your AI-use log, copied in as a table.

Marked under R5.

Figures and tables to include

	What it shows	Section
Table 1	Your constants: value, unit, source	2
Figure 1	The answer sheet (both lines, if you have the exact formula and the solver)	3
Figure 2	The loss curve	4
Figure 3	Your model against the answer sheet	4
Table 2	The comparison: accuracy, time per answer and size	5
Figure 4	Error against the number of examples	5
Table 3	The three checks and their results	6
Table 4	Your AI-use log	Appendix B

Before you submit

- The repository link works and the README runs in a fresh Colab session.
- Every figure and table is numbered and referred to in the text.

- Section 8 matches your AI-use log.
- The word count is on the title page.
- One PDF, named StudentNumber_Surname_Report.pdf.
